1.2	Visual cortex structure . . . . .	2
1.3	History . . . . .	2

# 1 Lecture 1

## 1.1 Motivation

Estimated that  $> 85\%$  of data online is "pixel-data". So image data is like the "dark matter" of the web - tons of it out there that sits, un-analyzed.

## 1.2 Visual cortex structure

We ourselves mostly visualize objects first as simple edge-like features. So when we see neural nets do the same thing, it seems like a deep result. We believe vision processing to be **hierarchical**.

## 1.3 History

Edge detection  $\rightarrow$  Objects are compositions of basic shapes when viewed from a particular angle  $\rightarrow$  Normalized cut as an attempt to group things into objects  $\rightarrow$  decision making in vision by engineering important **features** about the object  $\rightarrow$  PASCAL standardized image recognition **datasets** for competing on these tasks  $\rightarrow$  ImageNet dataset from Stanford

**Point of the course** *Image classification* - what is in whole image X?
